

Dear!

The LLC Ivstankoprom enterprise suggests you to consider our offer on cooperation in capital repair and modernization of heavy metal-cutting CNC machines at engineering plants.

On the defense plants deliveries of metal-cutting machines from the USSR and the Russian Federation were carried out. Many difficult technological processes were built with use of these machines which so far considerably physically became outdated.

Scale of machines put during this period, in particular the heavy horizontally boring processing centers with the CNC is serial for our enterprise. For the last 7 years we successfully made capital repairs and modernization of similar machines for the defense enterprises of the Russian Federation, we have all technical documentation and working drafts on modernization.

LLC Ivstankoprom is had competent experts (designers, technologists, mechanics, electronics engineers), many of which worked for 15-30 years in the machine-tool constructing industry and participated in design, start in production, assembly and start-up at customers of the processing centers, horizontally boring machines and other equipment.

All last years we specialized in repair and modernization of the metal-cutting equipment and we own all modern tools allowing to restore parameters of machines on the accuracy and rigidity, to give them new properties, using modern accessories and technologies.

The ideology of the company consists in provision of services on capital repairs and modernization of the difficult metal-cutting equipment as an alternative of purchase of the new metal-cutting equipment (which delivery in case of Iran is forbidden from the majority of the countries of producers of machines). It allows to reduce considerably expenses, to use the existing base under machines, in short terms to provide training of workers and service personnel, to use the available tool equipment. Eventually, the technology of capital repairs and modernization is completely identical to production of the new machine except for use of the existing basic cast details of machines. At the same time the quality of the made old pig-iron castings considerably exceeds in all respects characteristics of recently cast details.

Having own production base and processing equipment, we quickly and qualitatively make production of necessary details at repair that in turn does not delay process of the repair.

Besides, we offer a complex of engineering services that includes: development of manufacturing techniques of products and their introduction at the customer, design of mathematical models, processing visualization, development of the operating programs, development and production of devices and the equipment, delivery of the tool, service, including technical assistance and delivery of spare parts.

Thus, own production base, wide experience of work, workers and the designer of high qualification - all this allows to carry out repair of difficult processing equipment at the high level.

Best regards,

Director of LLC Ivstankoprom

Kosyakin Alexey Vasilyevich
